Saves Time and Sand

Road Commissioner Bela Fowler of Troy reported "I have used the first Bryant Automatic Sander that was built for three years without any breakdown whatever. It saves one-third of my time; also saves sand . . . I am satisfied that this is the most practical sander on the market today."

Easy to Remove

From Town Manager William M. Lunt, Jr., came this quote: "There is one big advantage with the Bryant Sander; that is the fact that, in a matter of minutes, the sander can be uncoupled and the truck is free for any use without special tailgate assembly."

Does Better Job

". . . We figure that by using this sander we are saving enough money on sand and salt to pay for the machine. Furthermore, we are doing a better job and taxpayers are better satisfied," wrote Fort Kent Town Manager Elbridge Gagnon.

Higher Speeds

Road Commissioner Warren Walton of Wayne noted "I like the sander real well. It does a wonderful job at speeds of 15 miles per hour or faster."

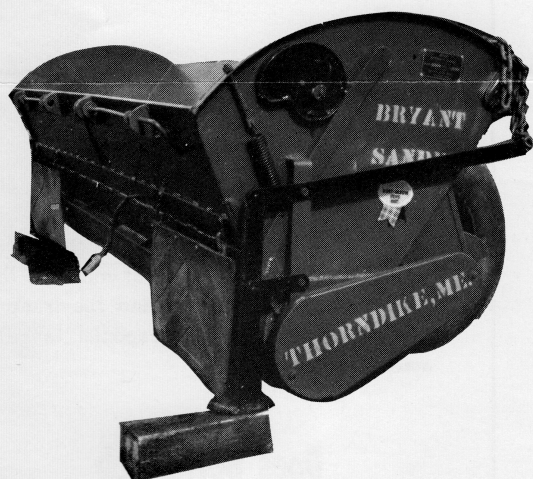

No Junks Problem

The Town Manager of Litchfield, Richard C. Smith, reported ". . . we are more than pleased with its operation thus far. Frozen junks of sand or snow are no problem to us any more . . . We find that it spreads a uniform cover of sand, thick or thin, whichever is our choice."

THE BRYANT SANDER

THE BRYANT SANDER is a self contained unit that can be easily attached to any dump truck for the purpose of spreading sand, salt, calcium chloride, or any other granular material.

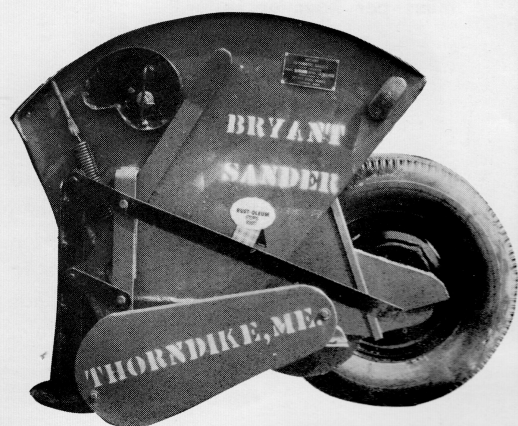

The design of the sander hopper allows constant flow of sand from body without overflowing, thus eliminating hand labor. One wheel drive provides sufficient power and gives even spread at any speed of travel. Only two moving parts in contact with sand: 1) drum which turns very slowly minimizing wear, 2) spring loaded gate which allows rocks to eject without damage.

Sander in Raised Position

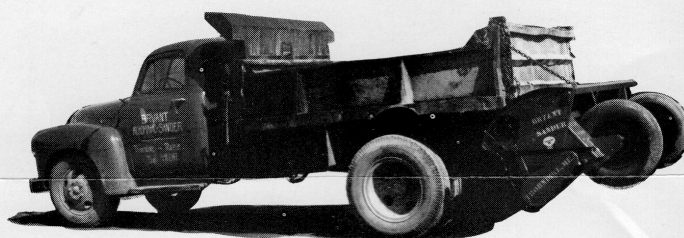

As body is lowered sander is raised automatically.

Due to the fact that there is no weight on the truck body until it reaches a nearly lowered position a sander can easily be raised even when fully loaded.

Easy Mounting and Removal

The Bryant Sander is easily installed and can be removed in minutes. Place blocks under self contained jacks, remove chains from body and lock jacks in place at desired height, remove pins and control linkage. Truck is now available for other uses.

Easy Set Dial Adjustments

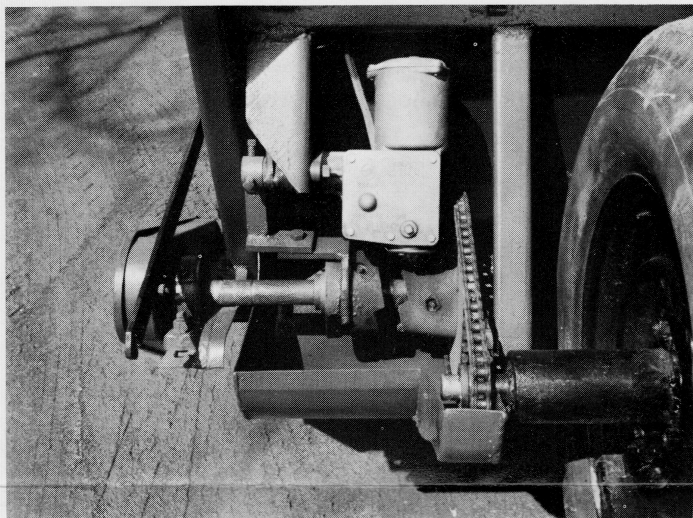

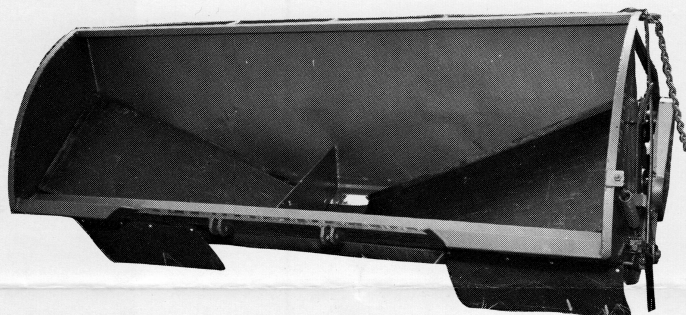

New eccentric dial on each end of machine gives six easily set adjustments.

Simply hold gate lever down and dial to desired application.

... An All-Season Time Saver

For Salting

Salt Plates are placed in each end of machine to allow spreading of salt in center of road. Also one may be used alone when sanding to narrow spread and conserve sand.

Cable or Electric Control

We have available the conventional cable control with lever in cab which is still used by many purchasers where tar covering is not essential. We have also developed the more popular electrical control system which adds extra convenience, and simplifies even more the initial installation. One switch in cab gives driver instant, trouble free control. All electric control machines have clearance lights as standard equipment.

Summer Tar Covering

By removing four bolts the axle and wheel assembly can be replaced with a 3 h. p. Briggs & Stratton engine which provides sufficient speed and power for tar covering.

Drop-down legs are a new optional feature for extra convenience when unit is used for tarring. Wheels are replaced later for winter use.

*Quality—Made
in Maine by
Maine Craftsmen*

Self-Locking, Spring loaded hitchpins make mounting and removal of the unit from truck a matter of seconds — No pins to remove or replace. Optional equipment includes a dolly wheel which snaps into hitch and makes for easy handling around yard or shop. One wheel can be used to handle several machines.

LOW IN PRICE — HIGH IN VALUE

A precision built machine especially designed to meet all-season highway maintenance needs in town and country—SEE IT TODAY.
